

ROBOTIC SURGERY / MEDTECH FIELD OPERATIONS

Bottava Predictive Maintenance

Predict which surgical robots need service — before a failure interrupts a case.

THE CHALLENGE

- Reactive service means unplanned downtime that disrupts surgical schedules.
- Fleet telemetry, case history, and site data live in disconnected silos.
- Teams lack an early-warning system to prioritize which robots to service first.

KEY CAPABILITIES

- Component-level ML maintenance risk score for every robot
- Prioritized watchlist that ranks the fleet by ML risk
- Geographic site map for location-aware triage
- Component heatmap isolating stressed parts
- Ask-in-plain-English analytics and AI recommended actions

AI-POWERED INSIGHT

A machine learning model weighs eight operational signals — errors, thermal stress, vibration, utilization, and service history — to score every component's maintenance risk, then an AI copilot explains each prediction in plain language with recommended next actions.

DATABRICKS PLATFORM

Lakeflow Pipelines

Unity Catalog

MLflow

Databricks Apps

Predict, don't react

Shift from failure-driven repairs to proactive, scheduled intervention across the fleet.

One governed workflow

Ingestion, ML, dashboards, and an operator app run on a single Unity Catalog-governed platform.

Explainable AI

Every risk score comes with a plain-language rationale and recommended maintenance action.
